hepatitis
australia

Hepatitis C is a virus that targets the liver. It can cause fatigue, liver pain and depression and can cause liver disease in some people.

Hepatitis C can be prevented. Hepatitis C is transmitted when the blood of someone with the virus enters someone else's bloodstream.

Some of the ways hepatitis C is spread in Australia nowadays are through:

UNSTERILE
TATTOOING PRACTICES

UNSTERILE
PIERCING PRACTICES

SHARING DRUG
INJECTING EQUIPMENT

If you inject, the best way to play it safe is to always inject with a new fit and don't share equipment. For tattoos or piercings the best option is to go to a licensed studio where sterile equipment is used to prevent infection. Remember, blood can be present even if you can't see it.
